

Tilt Table

Reduces heavy, awkward and frequent lifting

Description

One hundred and fifty pound corian sheets used to make countertops were picked up one at a time. Now a forklift picks up 5 sheets at a time and places them on a mechanical tilt table. The table then tilts to the vertical. The employee then slides the sheets over to a vertical saw for cutting. This reduces many lifts.

The table in horizontal position

The table is in motion, tilting to the vertical position.

For information about this control, [email an L&I ergonomist](#)

The tilt table is in the vertical position, and the employees slide it over to the right to saw while the sheet is in the vertical position.
